

# Nucleon Form Factors

- Introduction: EM form factors
- Experimental Techniques (BLAST)
- Proton Form Factor Ratio
- Neutron Electric and Magnetic Form Factors
- Summary

Ricardo Alarcon

The BLAST Collaboration

6<sup>th</sup> International Workshop on Chiral Dynamics, July 6-10, 2009 University of  
Bern

# EM Nucleon Form Factors

- They are the *basic observables defined in the context of a one-photon-exchange interaction.*

- They contain information about the electromagnetic *structure of the proton and the neutron* in the *non-perturbative region*. **Related to spatial distribution of charge and magnetism.**
- They should provide guidance on how to connect QCD to the NN force
- Extensively studied by ~ 50 years now, through electron scattering: SLAC, Saclay, Mainz, NIKHEF, MIT-Bates, JLab, ...
- They are required for knowledge of many other things:
  - structure of nuclei at short distances
  - Proton charge radius and Lamb shift
  - precision tests of Weak interaction at low  $Q^2$

# Nucleon Elastic Form Factors

$$\langle N(P') | J_{\text{EM}}^\mu(0) | N(P) \rangle = \bar{u}(P') \left[ \gamma^\mu F_1^N(Q^2) + i\sigma^{\mu\nu} \frac{q_\nu}{2M} F_2^N(Q^2) \right] u(P)$$

$$G_E = F_1 - \tau F_2; \quad G_M = F_1 + F_2, \quad \tau = \frac{Q^2}{4M^2}$$

# Nucleon Elastic Form Factors

- General definition of the nucleon form factor

$$\langle N(P') | J_{EM}^\mu(0) | N(P) \rangle = \bar{u}(P') \left[ \gamma^\mu F_1^N(Q^2) + i\sigma^{\mu\nu} \frac{q_\nu}{2M} F_2^N(Q^2) \right] u(P)$$

- Sachs Form Factors  $G_E = F_1 - \tau F_2$ ;  $G_M = F_1 + F_2$ ,  $\tau = \frac{Q^2}{4M^2}$

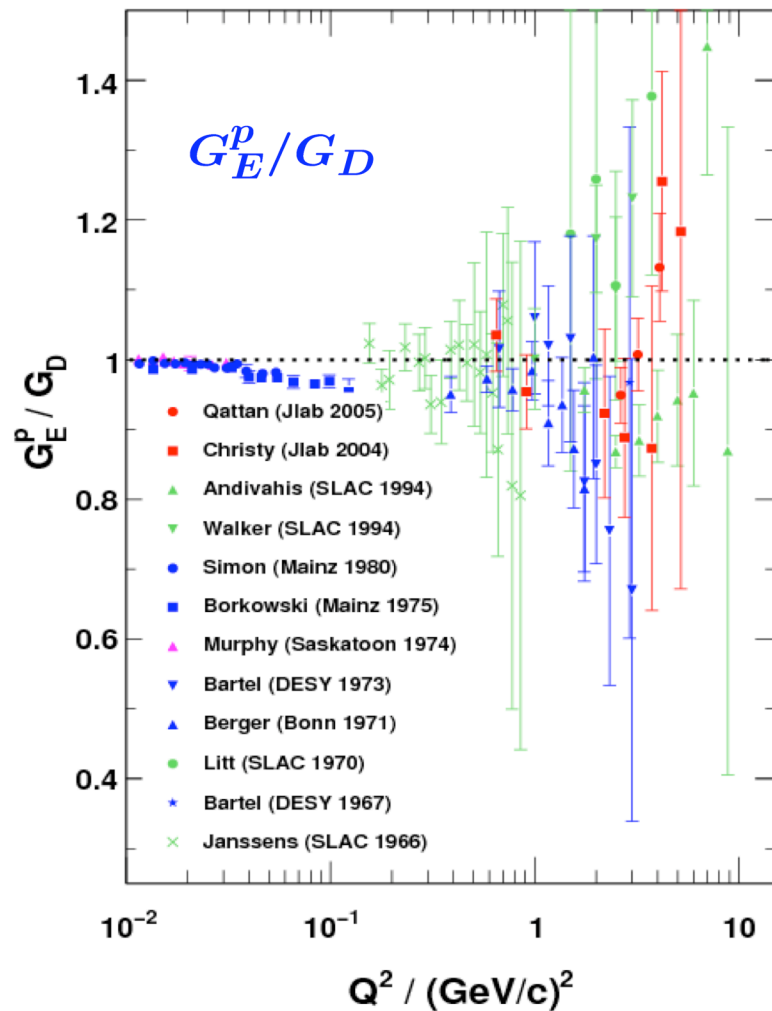

- In One-photon exchange approximation above form factors are observables of **elastic electron-nucleon** scattering

$$\begin{aligned} \frac{d\sigma/d\Omega}{(d\sigma/d\Omega)_{Mott}} &= S_0 = A(Q^2) + B(Q^2) \tan^2 \frac{\theta}{2} \\ &= \frac{G_E^2(Q^2) + \tau G_M^2(Q^2)}{1 + \tau} + 2\tau G_M^2(Q^2) \tan^2 \frac{\theta}{2} \\ &= \frac{\epsilon G_E^2 + \tau G_M^2}{\epsilon(1 + \tau)}, \quad \epsilon = \left[ 1 + 2(1 + \tau) \tan^2 \frac{\theta}{2} \right]^{-1} \end{aligned}$$

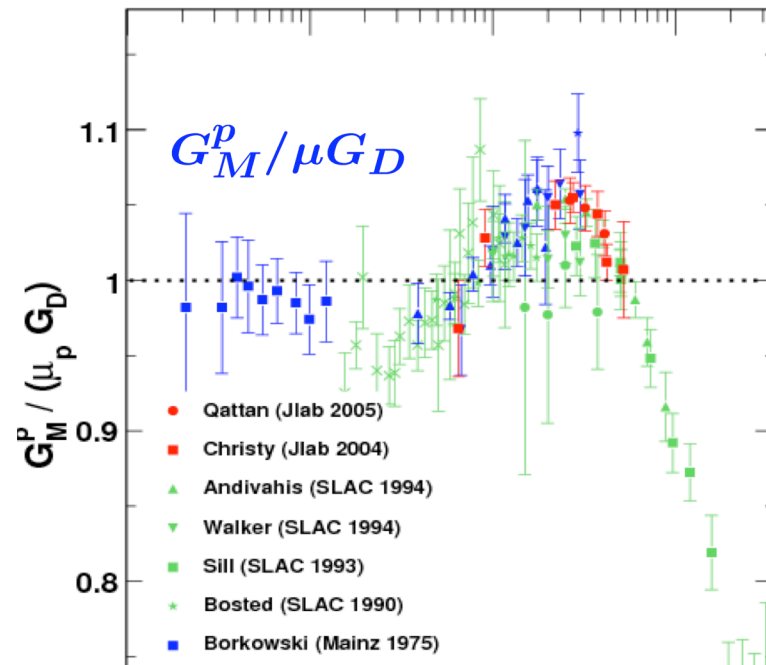

# Proton Form Factors from Cross Section Measurements

# Proton Form Factors: Cross Section Measurements

# Proton Form Factors: Cross Section Measurements

■  $G(Q^2)$   $\xleftrightarrow{\text{Fourier}}$   $\rho(r)$  charge and magnetization density (Breit fr.)

■ Dipole form factor  $G_D = \frac{1}{\left(1 + \frac{Q^2}{0.71}\right)^2} \leftrightarrow \rho_D(r) = \rho_0 e^{-\sqrt{0.71}r}$

■  $G_E^p \approx G_M^p / \mu_p \approx G_M^n / \mu_n \approx G_D$  within 10% for  $Q^2 < 10$  (GeV/c)<sup>2</sup>

# Nucleon Form Factors and Polarization

- Polarized beam + polarized target:**

Donnelly + Raskin, Ann. Phys. 169 (1986)247

$$A = \frac{\sigma_{\uparrow\uparrow} - \sigma_{\uparrow\downarrow}}{\sigma_{\uparrow\uparrow} + \sigma_{\uparrow\downarrow}} \propto \frac{a(\theta^*)G_M^2 + b(\theta^*)G_M G_E}{\sigma_{unpol}}$$

$$\vec{p}(\vec{e}e'p) \rightarrow \text{proton } G_E/G_M$$

$$\vec{d}(\vec{e}e'n) \rightarrow \text{neutron electric ff}$$

$$\vec{d}(\vec{e},e') \ ^3\text{He}(\vec{e}e') \rightarrow \text{neutron magnetic ff}$$

- Polarized beam + polarization of recoil nucleon:**

$$\frac{G_E}{G_M} = -\frac{P_T}{P_L} \frac{(E_e + E_e')}{2M_p} \tan \frac{\theta_e}{2}$$

$$d(\vec{e}e'\vec{n}) \quad \text{neutron electric ff}$$

$$p(\vec{e}e'\vec{p}) \quad \text{proton } G_E/G_M$$

Akhiezer+Rekalo, Sov.JPN 3 (1974) 277

# Recoil Polarization Technique

- Pioneered at MIT-Bates
- Pursued in Halls A and C, and MAMI A1
- In preparation for Jlab @ 12 GeV

V. Punjabi et al.,  
Phys. Rev. C71 (2005) 05520

FIG. 9: Schematic of the polarimeter chambers and analyzer, showing a non-central trajectory;  $\vartheta$  is the polar angle, and  $\varphi$  is the azimuthal angle from the  $y$ -direction counterclockwise.

## Focal-plane polarimeter

Secondary scattering of polarized proton from unpolarized analyzer

FIG. 15: Schematic drawing showing the precession by angle  $\chi_\theta$  of the  $P_l$  component of the polarization in the dipole of the HRS.

**Spin transfer formalism** to account for spin precession through spectrometer

# Polarized Targets

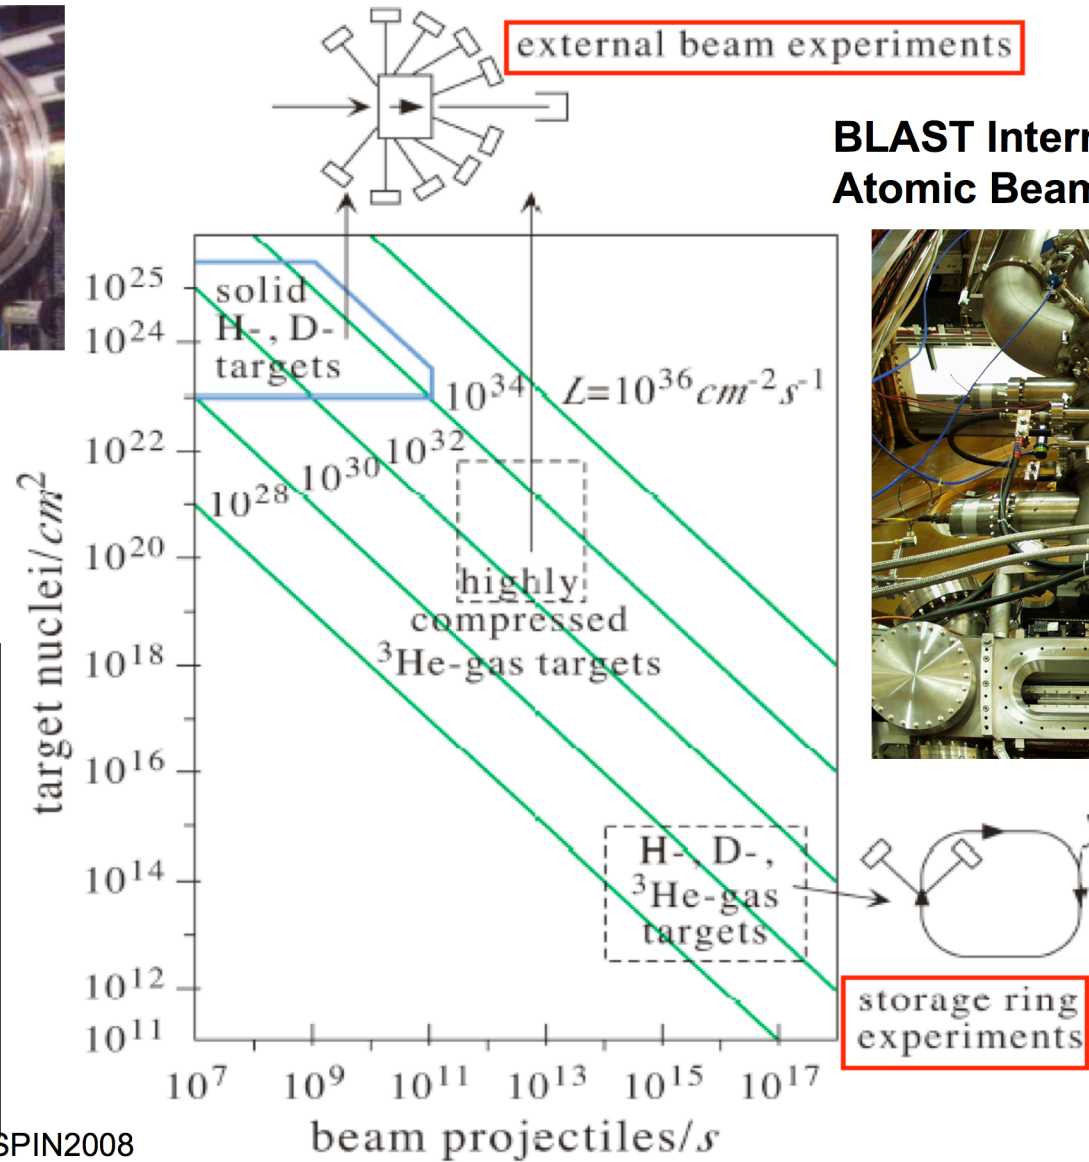

**UVA / "SLAC"-Target:  
Dynamic Nuclear Polarization**

**Limited luminosity for  
polarized  
hydrogen/deuterium  
targets,**

**Very precise at low to  
moderately high  $Q^2$**

from W. Meyer, SPIN2008

**BLAST Internal Target:  
Atomic Beam Source**

# Low $Q^2$ : BLAST at MIT-Bates

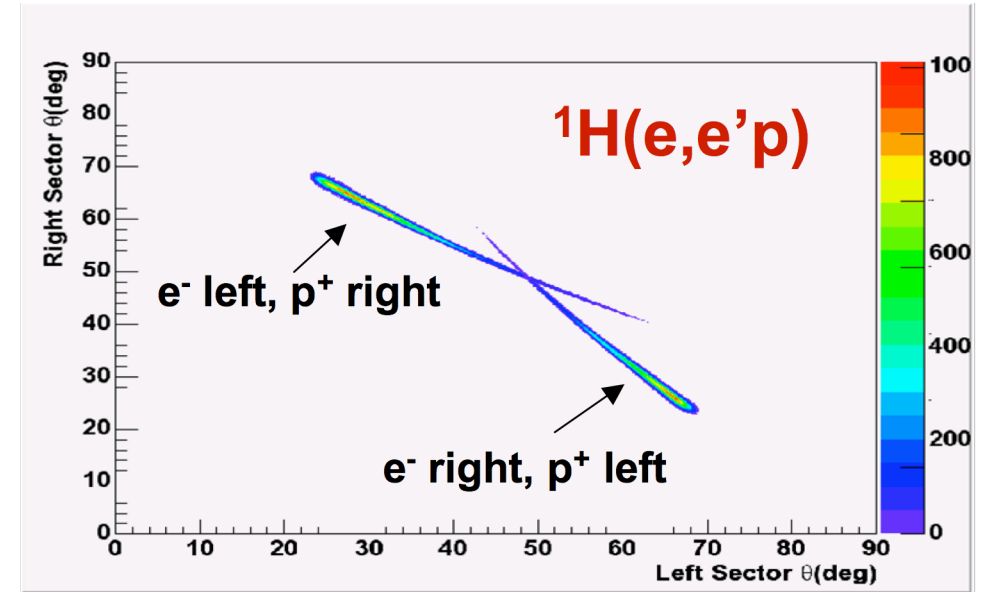

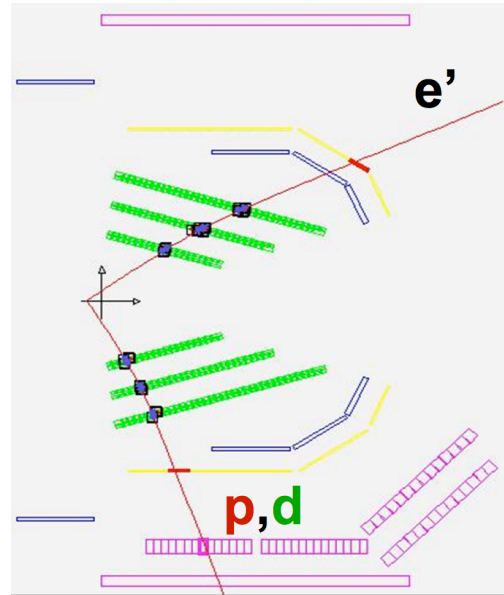

## Bates Large Acceptance Spectrometer Toroid

- Symmetric, large acceptance, general purpose detector  
Detection of  $e^\pm$ ,  $\pi^\pm$ ,  $p$ ,  $d$ ,  $n$
- Longitudinally polarized electrons in SHR  
850 MeV, 200 mA,  $P_e = 65\%$

- Highly polarized internal gas target of pure H and D (Atom Beam Source)  
 $6 \times 10^{13}$  atoms/cm<sup>2</sup>,  $L = 6 \times 10^{31}/(\text{cm}^2\text{s})$ ,  $P_{\text{H/D}} = 80\%$

# Summary

- **Nucleon** electromagnetic elastic form factors
- Tremendous progress during last decade
- High precision, low systematic uncertainties through polarization experiments
- Worldwide activity at its peak
- **Progress in past decade:**
  - High- $Q^2$  surprise in  $G_E^p/G_M^p$ ; strong impact on theoretical picture  
Evidence for **two-photon exchange** effects. Experimental verification is needed (OLYMPUS).
  - New precise picture of  $G_E^n$  for  $Q^2 < 1.5$  (GeV/c) $^2$ ,  $G_M^n < 5$  (GeV/c) $^2$
  - Evidence for **structure beyond  $G_{Dipole}$**  at low  $Q^2$  in all form factors
  - VMD description very successful
- **Many new experiments underway or proposed**
